

IAIO

INTERNATIONAL ARTIFICIAL INTELLIGENCE ORGANIZATION

PEOPLE • SAFETY • COOPERATION • A SHARED FUTURE

Responsible AI for a Better Tomorrow

Executive Brief

Executive Brief

International Artificial Intelligence Organization (IAIO)

A Proposal for Global Governance of Artificial Intelligence, Robotics, Autonomous Systems, and Frontier Intelligence

Author: Marlos M. Silva
Version: 1.0
Date: October 2026

Executive Summary

Artificial Intelligence is rapidly becoming critical infrastructure for governments, businesses, healthcare systems, transportation networks, financial institutions, and national security operations. While AI technologies increasingly operate across national borders, governance remains fragmented among national governments, regional regulations, voluntary standards, and international initiatives. Existing organizations provide important guidance and coordination, but there is no single international institution responsible for establishing globally recognized AI governance standards comparable to the role played by the International Civil Aviation Organization (ICAO) in aviation. [oecd.ai], [oecd.ai], [unesco.org], [aigovernancecore.com]

This brief proposes the establishment of the **International Artificial Intelligence Organization (IAIO)**, a treaty-based international organization designed to coordinate global AI governance, safety standards, incident reporting, certification frameworks, and international cooperation.

Necessity of the International Artificial Intelligence Organization (IAIO)

The international community has established important foundations for AI governance through the OECD, the Global Partnership on Artificial Intelligence (GPAI), UNESCO, and ISO/IEC, which provide policy guidance, ethical frameworks, technical standards, and forums for cooperation. [oecd.ai], [oecd.ai], [unesco.org], [aigovernancecore.com]

However, no existing institution possesses a comprehensive international mandate to coordinate AI governance, investigate major AI incidents, oversee high-risk and frontier AI systems, or facilitate coordinated responses to cross-border AI risks. As AI increasingly powers critical infrastructure, robotics, autonomous systems, and global digital services, the absence of a dedicated governance body presents a growing institutional gap. [unesco.org], [aigovernancecore.com]

The proposed **International Artificial Intelligence Organization (IAIO)** would complement, not replace, existing initiatives by providing a permanent framework for international coordination, safety oversight, incident investigation, certification, and governance of advanced AI and autonomous technologies. In doing so, it would help ensure that AI develops in a manner that is safe, transparent, interoperable, and aligned with the shared interests of the international community. [oecd.ai], [oecd.ai], [unesco.org], [aigovernancecore.com]

---

1. Problem Statement

Artificial Intelligence is advancing faster than the governance structures designed to oversee it.

AI systems now influence:

- Healthcare decisions
- Transportation systems
- Financial services
- Public administration
- Critical infrastructure
- Cybersecurity operations
- Scientific research
- Robotics and autonomous systems

As AI becomes increasingly integrated into societies and economies, risks are also expanding:

- Cross-border AI failures
- Autonomous system accidents
- Algorithmic discrimination
- Large-scale misinformation
- Critical infrastructure disruptions
- Cybersecurity threats
- Autonomous weapons proliferation
- Loss of public trust

Unlike aviation, telecommunications, or nuclear safety, there is currently no global institution with a mandate to coordinate AI governance, investigate major incidents, establish common standards, or facilitate international cooperation on AI risks. Existing efforts remain distributed among multiple organizations and jurisdictions. [oecd.ai], [oecd.ai], [unesco.org], [aigovernancecore.com]

---

2. Why Current Governance is Insufficient

The international community has made important progress through organizations such as the OECD, Global Partnership on Artificial Intelligence (GPAI), UNESCO, and ISO/IEC. These initiatives

have developed valuable principles, ethical frameworks, technical standards, and policy guidance. [oecd.ai], [oecd.ai], [unesco.org], [aigovernancecore.com]

However, significant gaps remain:

Fragmented Regulation

Countries are developing AI regulations independently, creating inconsistent requirements and increasing complexity for organizations operating internationally.

Limited International Coordination

There is no permanent global mechanism for coordinating responses to major AI incidents or emerging risks.

Absence of Global Certification

High-risk AI systems can be deployed without internationally recognized certification or safety validation frameworks.

Insufficient Robotics Oversight

Governance discussions often focus on software while autonomous vehicles, drones, industrial robots, and humanoid robots increasingly interact with the physical world.

Frontier AI Governance Gap

Highly capable AI systems are advancing rapidly, while international oversight mechanisms remain limited and largely voluntary. [oecd.ai], [aigovernancecore.com]

Lack of Incident Investigation

Unlike aviation, there is no independent international body responsible for investigating major AI-related accidents and publishing lessons learned.

---

3. The IAIO Concept

The **International Artificial Intelligence Organization (IAIO)** would be established through an international convention and operate as a neutral, multilateral institution dedicated to the safe, responsible, and beneficial development of AI.

Core Mission

To promote international cooperation and establish globally recognized governance frameworks for AI, robotics, autonomous systems, and frontier intelligence technologies.

Key Functions

Global Standards

Develop internationally recognized standards for:

- AI safety
- Transparency
- Accountability
- Risk management
- Robotics governance
- Cybersecurity

Certification Frameworks

Establish certification programs for high-risk AI applications in:

- Healthcare
- Transportation
- Critical infrastructure
- Financial systems
- Public sector operations

International AI Registry

Maintain transparency regarding designated high-risk and frontier AI systems.

Incident Investigation Bureau

Investigate major international AI incidents and publish recommendations to improve safety and governance.

Emergency Response Mechanism

Coordinate international responses to significant AI-related crises.

Capacity Building

Support countries in adopting effective governance practices while promoting innovation and economic development.

---

4. Expected Benefits

For Governments

- Better risk management
- Improved international cooperation
- Reduced regulatory fragmentation

- Access to shared expertise and best practices

For Industry

- Clear and predictable global standards
- Reduced compliance complexity
- Increased public trust
- Greater international interoperability

For Citizens

- Stronger safeguards against harmful AI use
- Increased transparency and accountability
- Greater protection of rights and freedoms

For the International Community

- Coordinated responses to emerging AI risks
- Shared safety standards
- Improved incident reporting and learning
- Responsible innovation at global scale

For Future Technologies

The IAIO would create governance foundations capable of adapting to advances in:

- Humanoid robotics
- Autonomous transportation
- AI agents
- Advanced scientific AI
- Frontier intelligence systems

---

5. Proposed Implementation Roadmap

Phase 1: Global Consultation (Years 1-2)

Engage:

- Governments
- Academic institutions
- Industry leaders

- Civil society organizations
- International organizations

Objective:

- Identify governance gaps
- Build consensus
- Refine the IAIO framework

Phase 2: International Working Group (Years 2-3)

Establish a multi-stakeholder working group responsible for:

- Governance design
- Legal analysis
- Technical standards development
- Treaty preparation

Phase 3: Global Summit on AI Governance (Years 3-4)

Convene participating nations and stakeholders to:

- Review recommendations
- Negotiate foundational principles
- Develop an initial convention framework

Phase 4: Treaty Negotiation (Years 4-5)

Draft and negotiate:

Convention on the International Artificial Intelligence Organization (CIAIO)

This treaty would define:

- Governance structures
- Membership requirements
- Compliance mechanisms
- Funding arrangements

Phase 5: IAIO Launch (Years 5-7)

Establish:

- Assembly of Member States
- Executive Council
- Secretariat
- AI Safety Board
- Robotics and Autonomous Systems Commission
- International AI Incident Investigation Bureau

Conclusion

Artificial Intelligence is becoming one of the most transformative technologies in human history. Like aviation, nuclear energy, and telecommunications before it, AI increasingly transcends national borders and requires international coordination.

The proposed **International Artificial Intelligence Organization (IAIO)** offers a practical framework for promoting innovation while establishing the governance structures necessary to ensure safety, accountability, transparency, and international cooperation.

By acting proactively, nations can work together to ensure that artificial intelligence remains a force for economic growth, technological progress, and human well-being for generations to come.

Proposed Action

This Executive Brief recommends initiating an international dialogue among governments, researchers, industry leaders, and civil society organizations to evaluate the feasibility of creating the **International Artificial Intelligence Organization (IAIO)** as a cornerstone of future global AI governance.
